From AI tools to AI delivery systems

Moving beyond code generation to real enterprise outcomes

Andrés Arroyo Samayoa
Cloud Management/SW Solution Architect
aarroyo@gbm.net

IBM

What did Bob unlock for IBM?

IBM Bob began as an internal initiative to modernize complex enterprise software faster, safer, and cheaper.

Rapid organic adoption across IBM demonstrates its ability to scale, while keeping costs and governance in check.

Market Challenges

- Average of 60–70% of engineering spend tied up in modernization vs. new innovation
- Teams struggled with multi-repo, multi-language, and interdependent systems
- Existing assistants couldn't handle system-level changes, governance, or security at scale

Our Approach

- Built around real internal enterprise workflows, not isolated tasks
- Structured, multi-step execution across code, tests, pipelines, and security
- 40% of Bob was built by Bob itself
- Product-led adoption driven by quality and outcomes, not mandates

"Bob is more than just a technical partner. Bob is the very partner for your product development."

Casey Golan,
Senior Engineering Manager IBM Software

150k IBM'ers onboard organically (and growing)

95% of IBMers use Bob across the SDLC, not just code generation

45% Average productivity gains measured

2025 showed that AI reshaped how software is built, setting the stage for a new model of enterprise delivery.

What 2025 taught us…

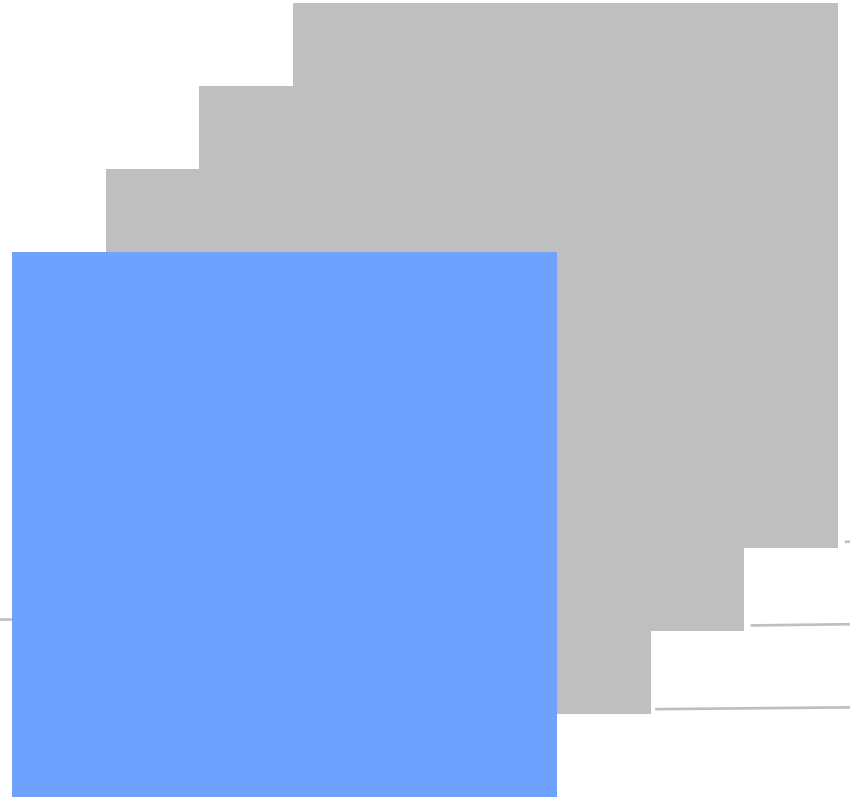

- AI increased individual developer throughput
- Security and governance had to keep pace
- AI improved code understanding and modernization
- Tools remained largely isolated

…and what systems must incorporate next

- ✓ Optimize organizational delivery productivity
- ✓ Embed security and governance across the SDLC
- ✓ Integrate architectural and operational context
- ✓ Govern cost and resource consumption

Enterprise delivery is shaped by layers that are not always made visible to development teams

Current AI development tools and agents excel where context is explicit….

Developer workflows

…but enterprise delivery goes beyond what is explicit.

This is where organizations lack visibility during development, but where outcomes are determined.

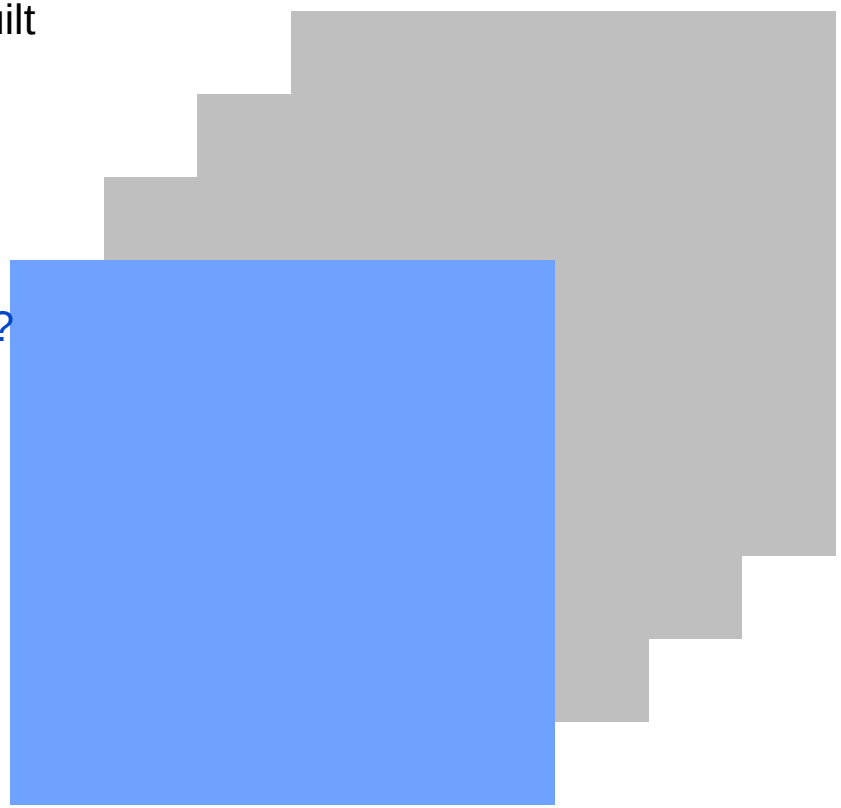

Security & risk control

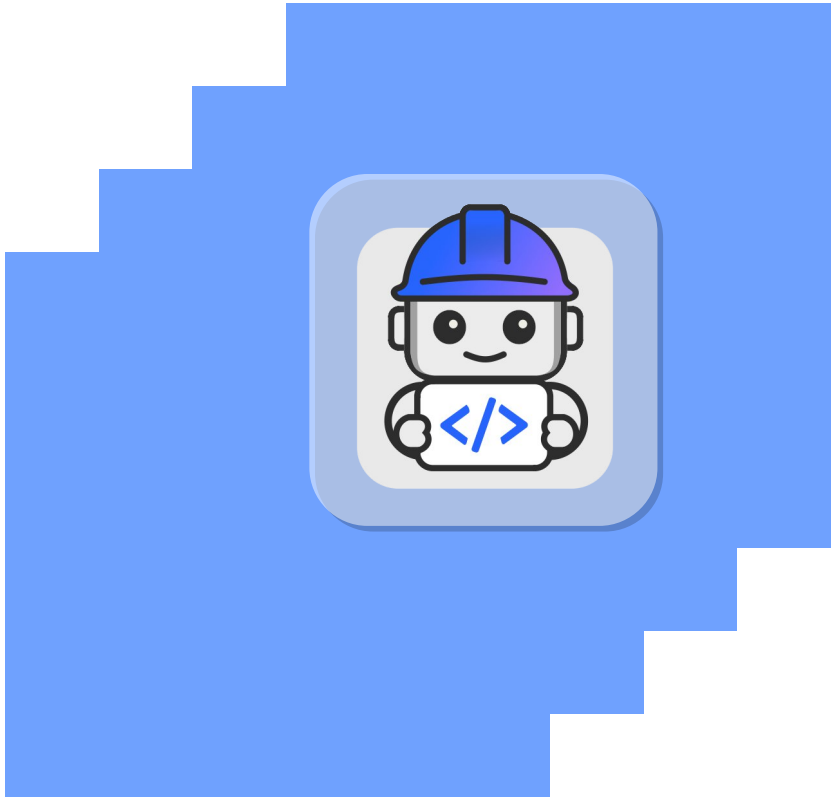

Cost & operational signals

Complexity & scale

Most AI development tools are built for what teams can see, not what might drive outcomes.

Point tools increase local developer productivity…but are enterprises asking for *more* code?

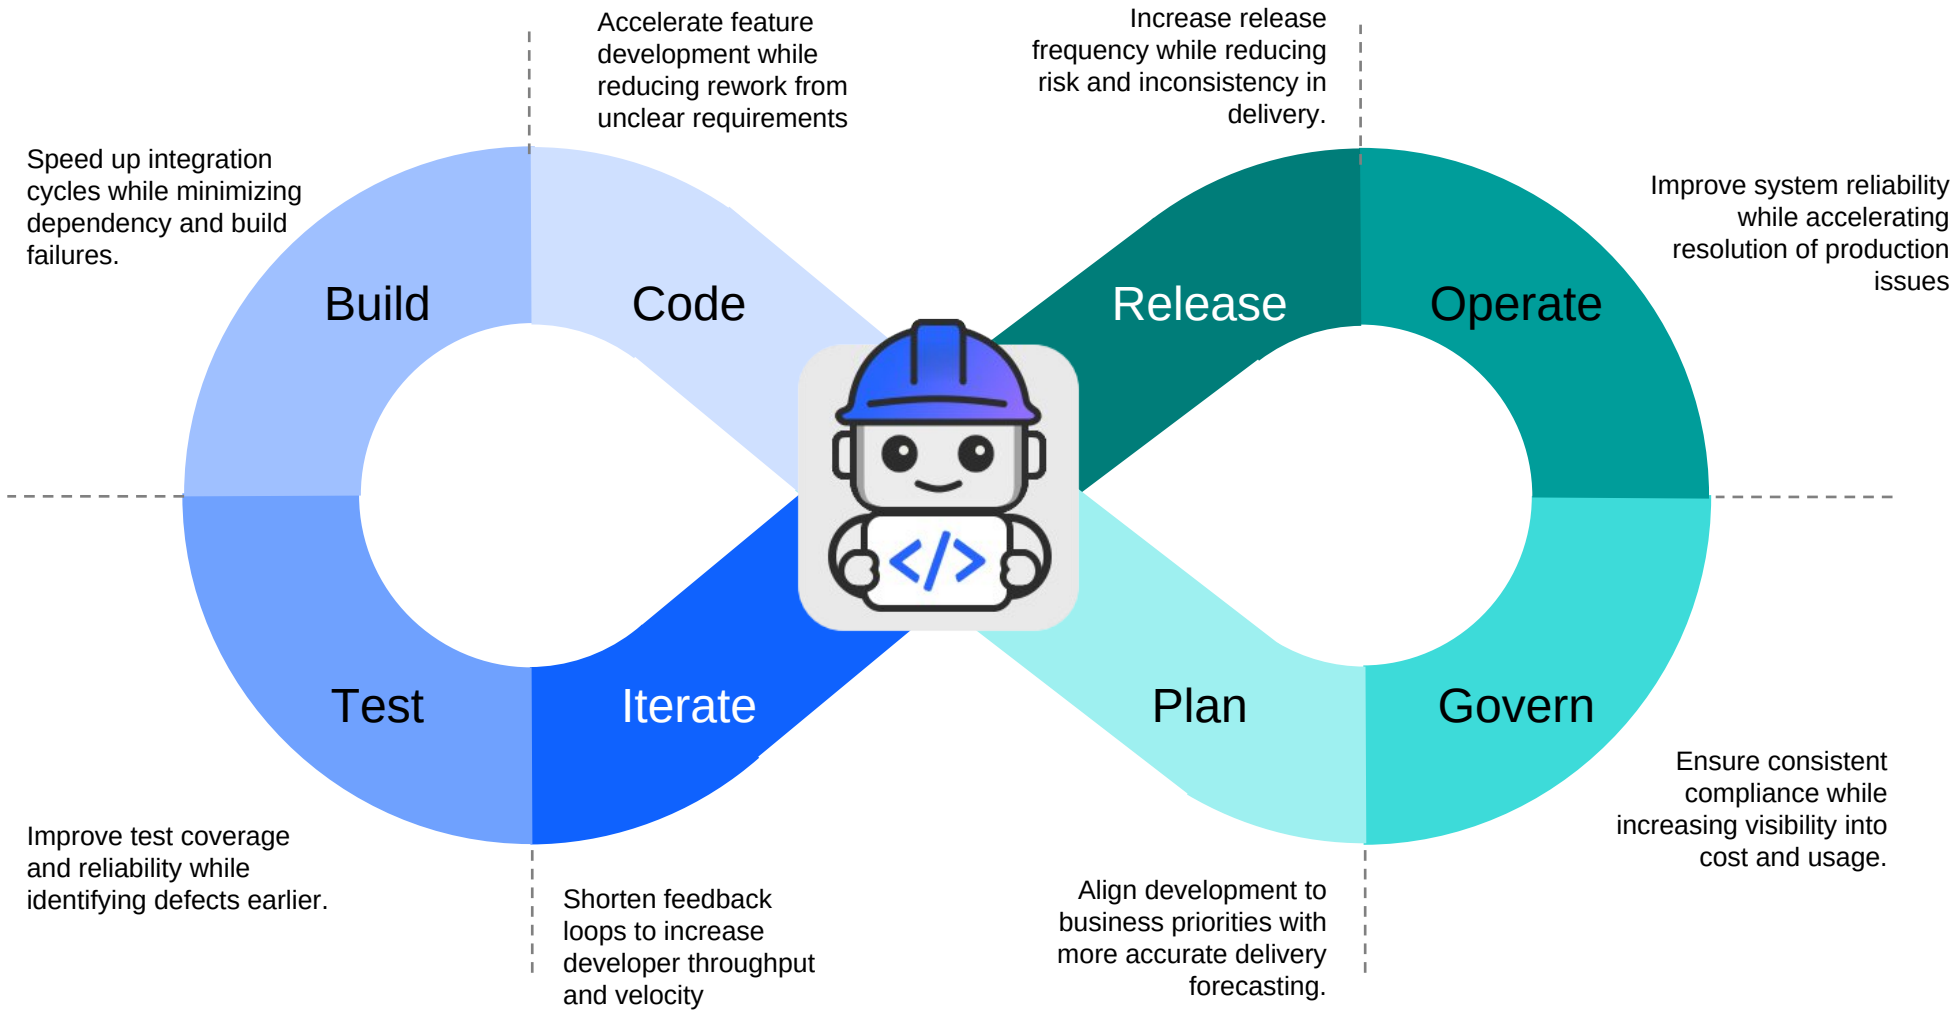

What are enterprises asking for?

- A system, not another AI tool
- A partner across lifecycles
- Outcomes, not just speed

This is why we built IBM Bob:
to help teams move from isolated tools to coordinated and governed delivery across the entire software development lifecycle

What does Bob unlock for your business?

Translate coordinated delivery into measurable business value across the software lifecycle

What did Bob unlock for IBM?

IBM Bob began as an internal initiative to modernize complex enterprise software faster, safer, and cheaper.

Rapid organic adoption across IBM demonstrates its ability to scale, while keeping costs and governance in check.

Market Challenges

- Average of 60–70% of engineering spend tied up in modernization vs. new innovation
- Teams struggled with multi-repo, multi-language, and interdependent systems
- Existing assistants couldn’t handle system-level changes, governance, or security at scale

Our Approach

- Built around real internal enterprise workflows, not isolated tasks
- Structured, multi-step execution across code, tests, pipelines, and security
- 40% of Bob was built by Bob itself
- Product-led adoption driven by quality and outcomes, not mandates

What does Bob unlock for the IBM portfolio?

For organizations building with IBM technologies, Bob accelerates how intent is translated into outcomes.

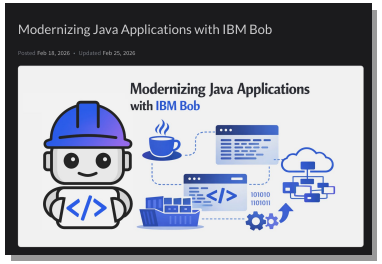

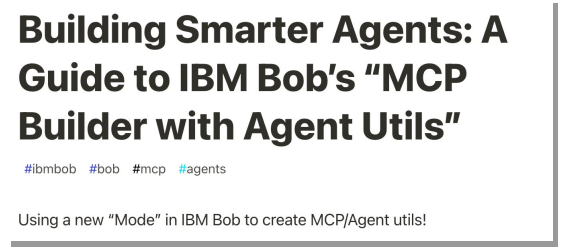

How Bob puts IBM expertise to work

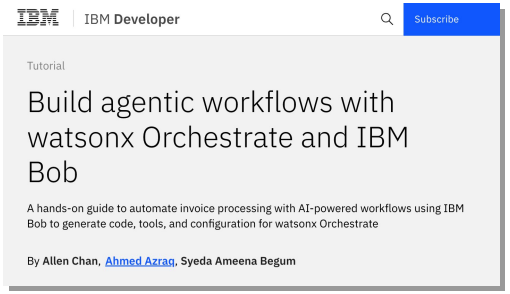

- Deep understanding of Java, COBOL, RPG, IBM i, and mainframe environments.
- MCP integrations connects Bob into other IBM products and workflows.
- Premium Packages that offer IBM platform-specific workflows, optimizations, and domain expertise.

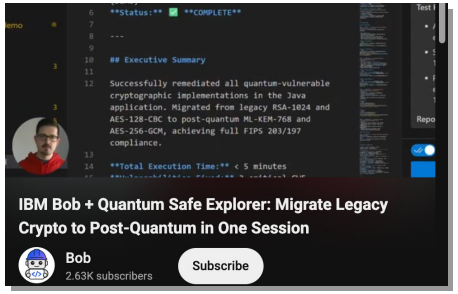

We also have +140,000 IBM'ers that are…

- Creating enterprise-grade Skills, MCP plugins, and custom Modes
- Sharing first-hand learnings that accelerate customer time-to-value
- Building cross-product tutorials
- Creating, testing, and validating workflows for enterprises
- Feeding learnings back into Bob for improved customer experiences

Applying AI across software delivery requires a new set of considerations.

Here’s how IBM Bob delivers across each.

1

Enabling teams

Teams are evolving from writing code to orchestrating outcomes

2

Modernization at scale

Enterprise change happens across systems, not in isolated codebases

3

Shift-left security

Security is continuous as AI is embedded into delivery workflows

4

Cost optimization

AI introduces new cost dynamics that require real-time visibility and control

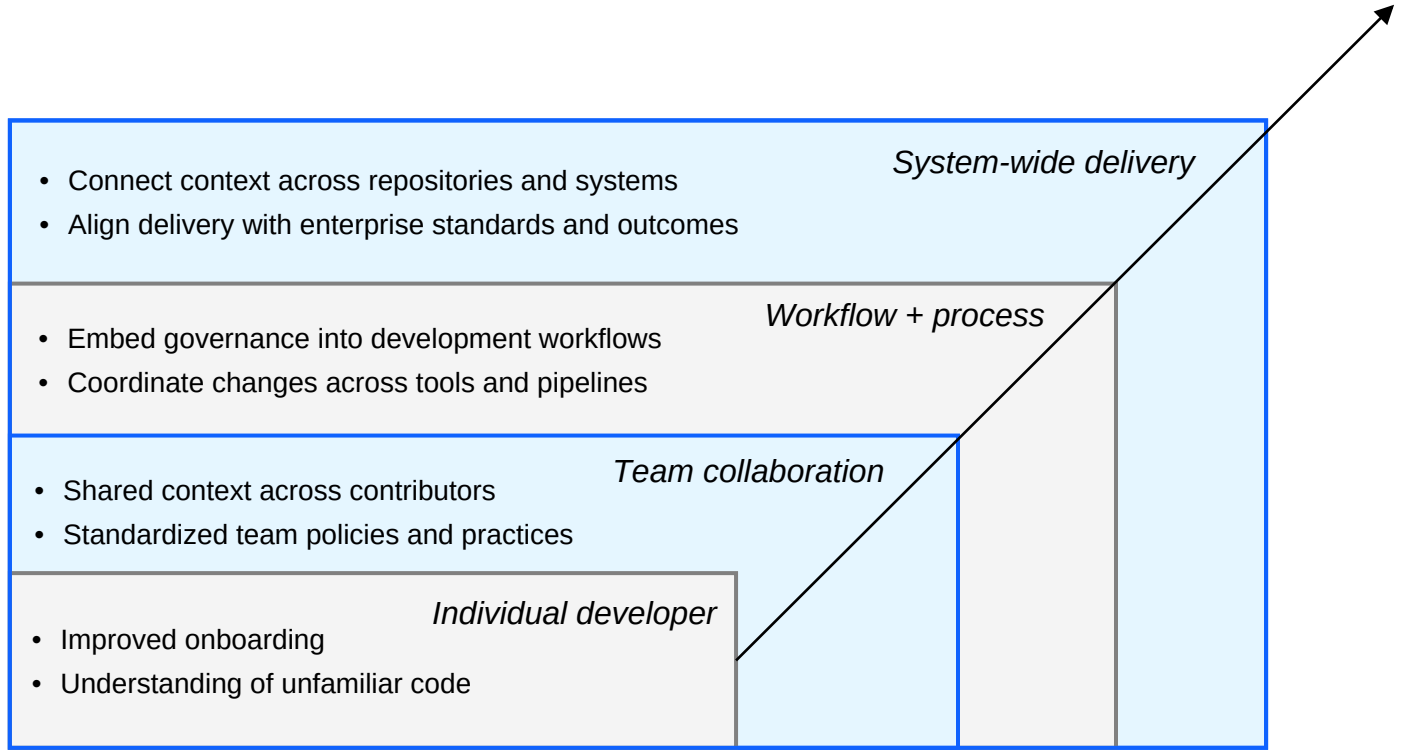

Enabling teams

High-performing teams are moving beyond isolated development toward coordinated, system-aware delivery.

Development today spans environments, where context is often fragmented.

IBM Bob helps unify that context, enabling teams to understand systems and deliver outcomes at scale.

With IBM Bob, teams scale from local productivity to coordinated & system-wide delivery across the enterprise

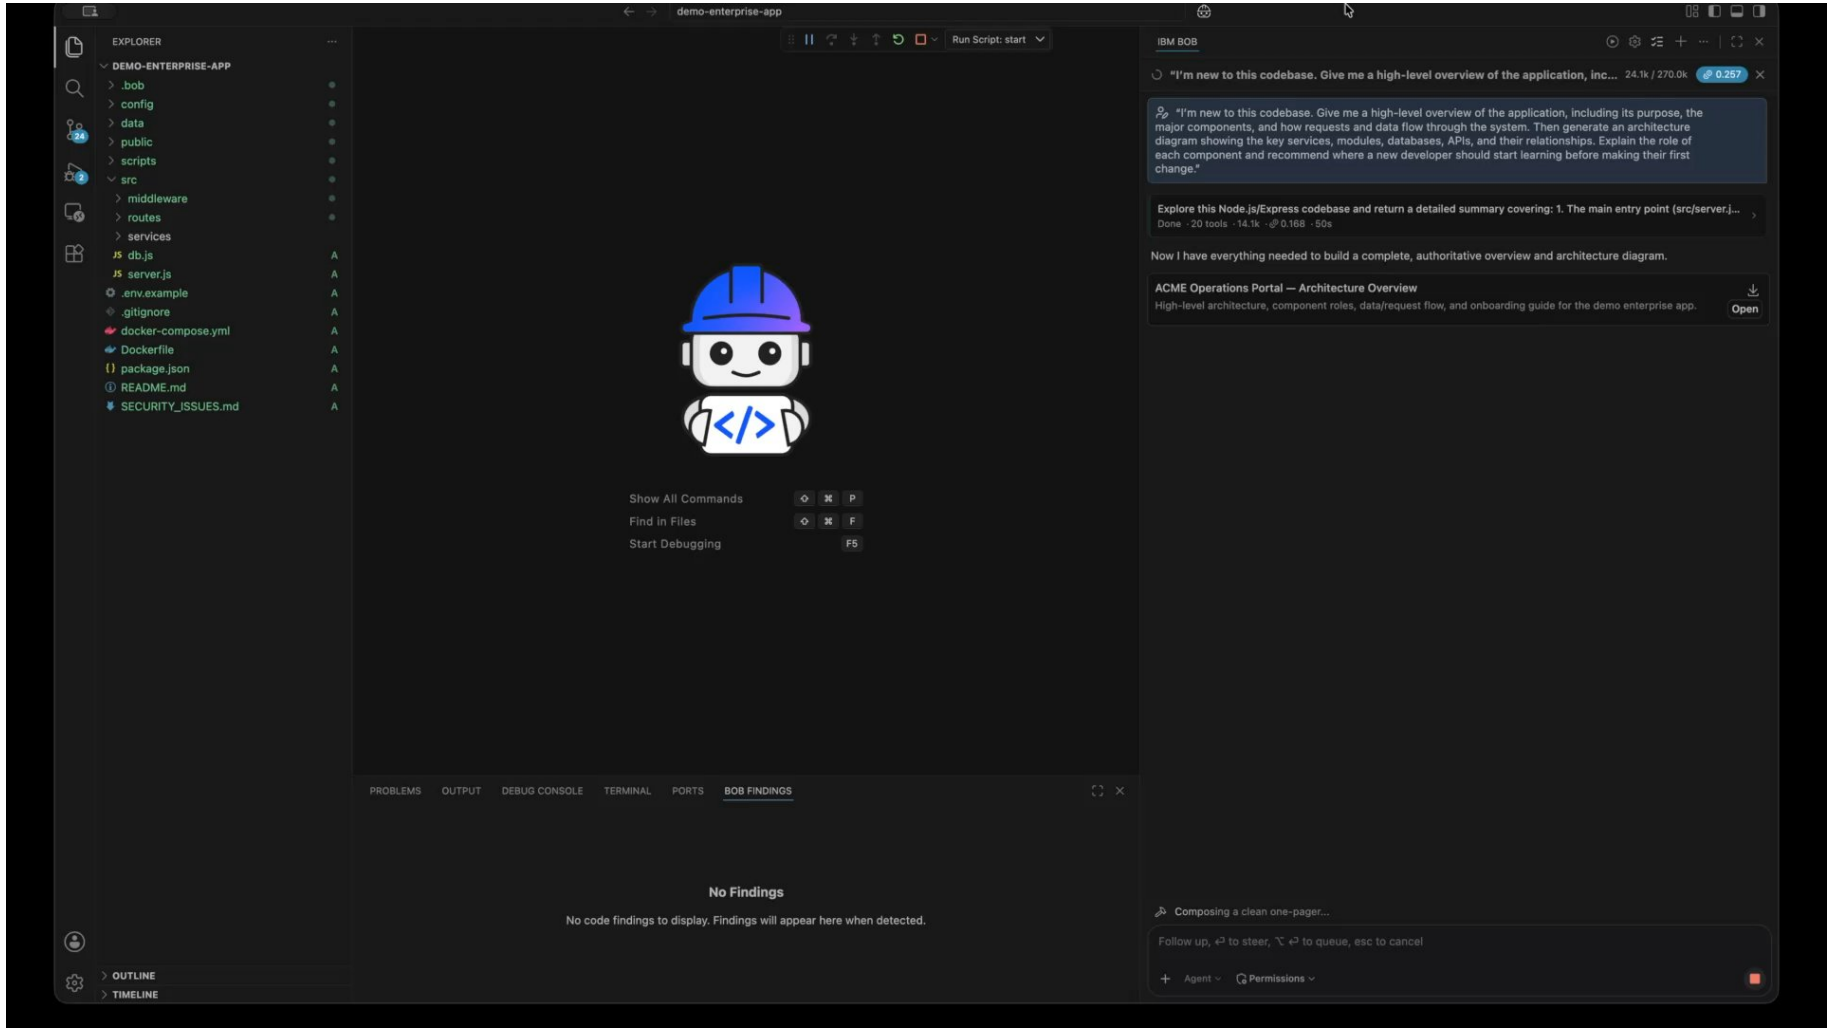

Enabling teams

High-performing teams are moving beyond isolated development toward coordinated, system-aware delivery.

Development today spans environments, where context is often fragmented.

IBM Bob helps unify that context, enabling teams to understand systems and deliver outcomes at scale.

Enabling teams

Real world examples of organizations enabling teams by increasing developer effectiveness and coordination

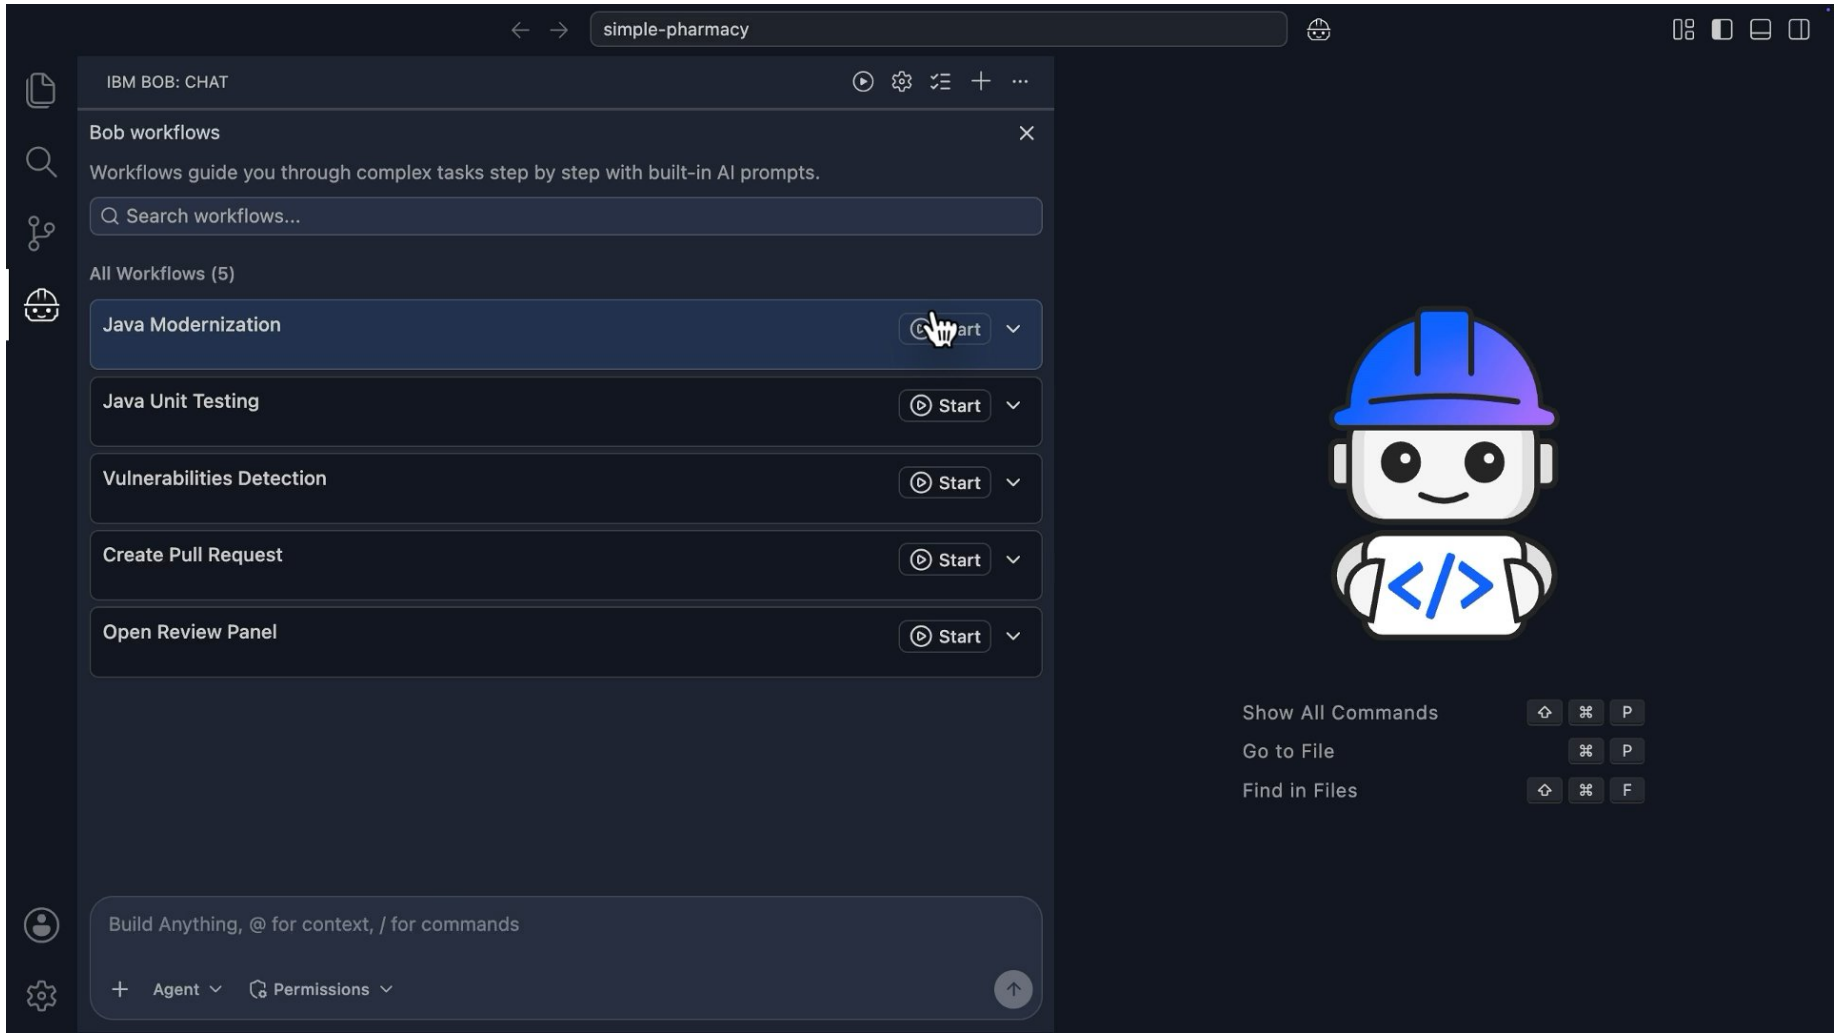

Use case	How did Bob help?	Results
Codebase documentation	*Bob analyzed legacy EGL and mainframe code to generate comprehensive documentation, diagrams, and scripts.*	**10x faster** documentation
Automated documentation & in-line comments	*Bob analyzed codebases to auto-generate documentation, architecture insights, and inline comments.*	**100% code coverage** with inline comments and documentation
Codebase understanding & onboarding	*Provided contextual code insights, generated diagrams, suggested improvements, and streamlined understanding.*	**First visual architecture** diagrams to document the codebase
Skill development & training	*Bob explained JCL purpose, contextualized components, and clarified dependencies through natural language..*	**Reduced barriers** for new talent entering mainframe development
Feature development	*Bob clarified requirements, scaffolded the full project, and generated a production-ready MCP server*	**Reduced multi-day development to minutes**

Modernization at scale

Enterprises are not modernizing isolated applications.

They are transforming deeply interconnected systems where risk, dependencies, and scale must be managed together.

IBM Bob helps teams understand system relationships, execute coordinated changes, and modernize with confidence across the enterprise.

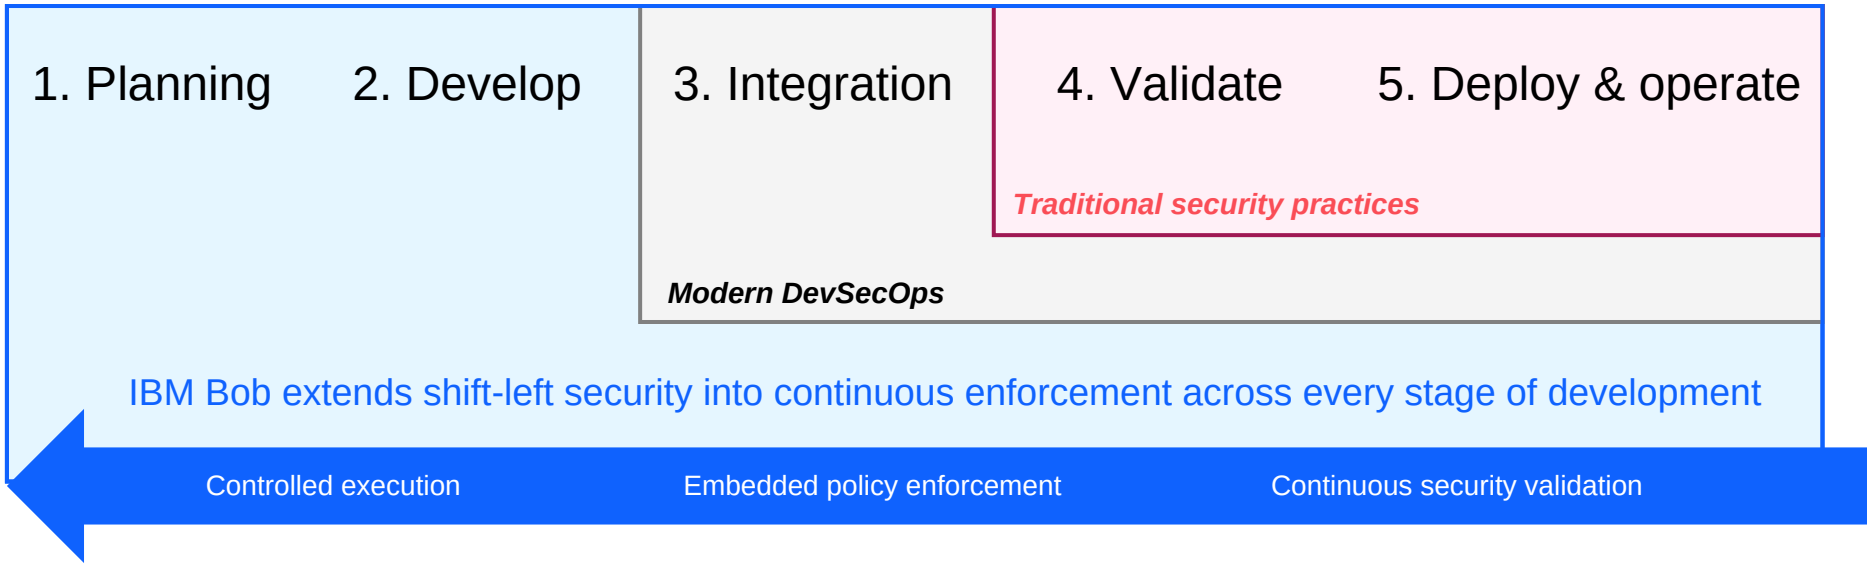

Shift-left security

As AI accelerates development, security must evolve from a checkpoint to an embedded capability.

But security policies, validation, and compliance are often applied late, creating risk and slowing delivery.

IBM Bob embeds security into development workflows, enforcing policies and validating changes continuously across the lifecycle.

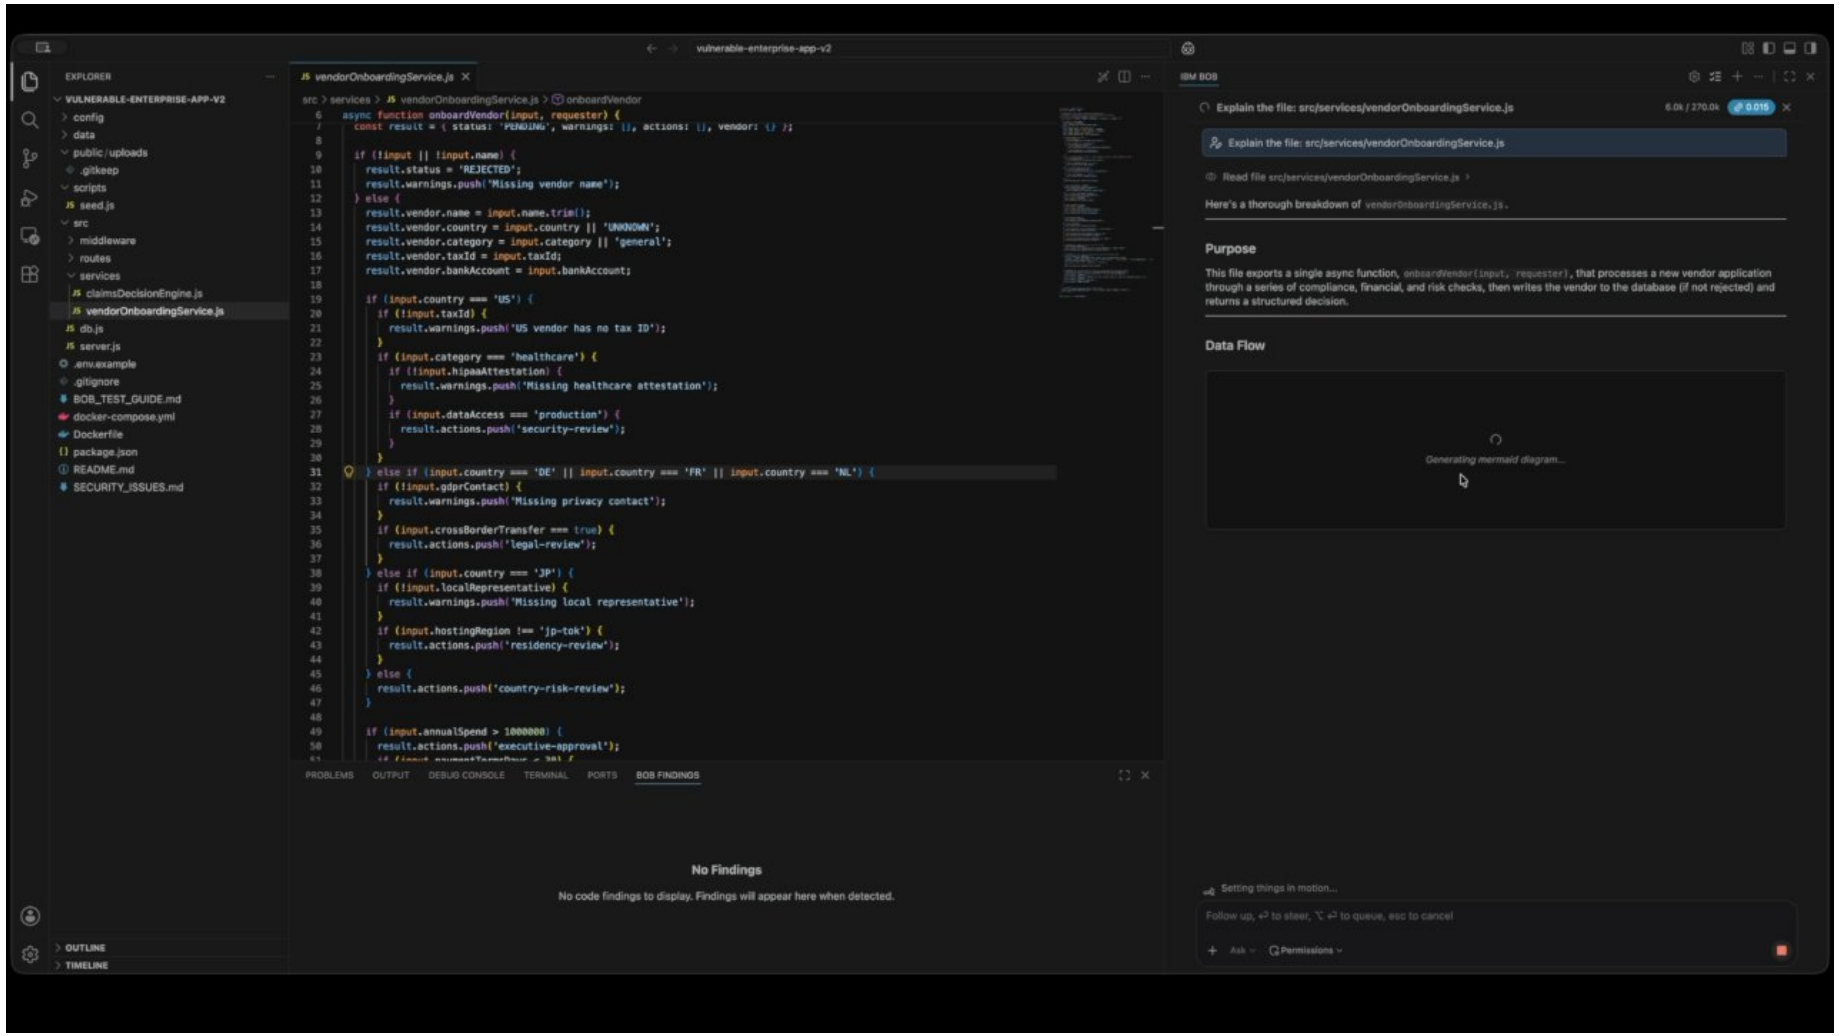

Shift-left security

As AI accelerates development, security must evolve from a checkpoint to an embedded capability.

But security policies, validation, and compliance are often applied late, creating risk and slowing delivery.

IBM Bob embeds security into development workflows, enforcing policies and validating changes continuously across the lifecycle.

Shift-left security:

Real-world examples of organizations embedding compliance and governance while remaining in control

Use case	How did Bob help?	Results
Test automation & monitoring	*Bob designed and built a test automation app, enabling rapid development, multi-API support, and real-time monitoring.*	**160+ engineering hours** saved
Governed code changes & approval workflows	*Bob enabled checkpoint-driven modernization with automated validation workflows and architecture guidance.*	**Captured complex logic** in easy-to-follow Mermaid diagrams
Architecture compliance & standards enforcement	*Bob enforced architecture standards through approval-based refactoring workflows, ensuring compliant code with full change visibility and control.*	**100% architecture compliance** for refactored code
Regulatory industries	*Bob automated testing, improving coverage and enforcing quality standards early to reduce risk.*	**Complete test coverage** for all functions in the codebase

Cost optimization

Cost for AI tools is real-time engineering signal that must be actively managed.

But model behavior and resource consumption are often opaque and difficult to control.

IBM Bob provides visibility, control, and optimization of cost across workflows, enabling teams to scale AI usage responsibly.

With IBM Bob, you have a decisioning system that optimizes cost at every step

Task classification:
What is the nature of the task?

Complex + multi-file
↓
Simple explanation
↓
Bulk + repetitive task
↓
Sensitive + regulated

Intelligent model routing:
How should this task be executed?

High- reasoning
↓
Cost-efficient
↓
Other cost criteria

Admin cost controls
Is this within expected cost & value?

Within budget
↓
Approaching budget
↓
Exceeds threshold
↓
Pause or approve

Attribution & outcome mapping
Was the cost justified?

High value: scale
↓
Low value: optimize
↓
Repeatable

Workflow optimization
What should change going forward?

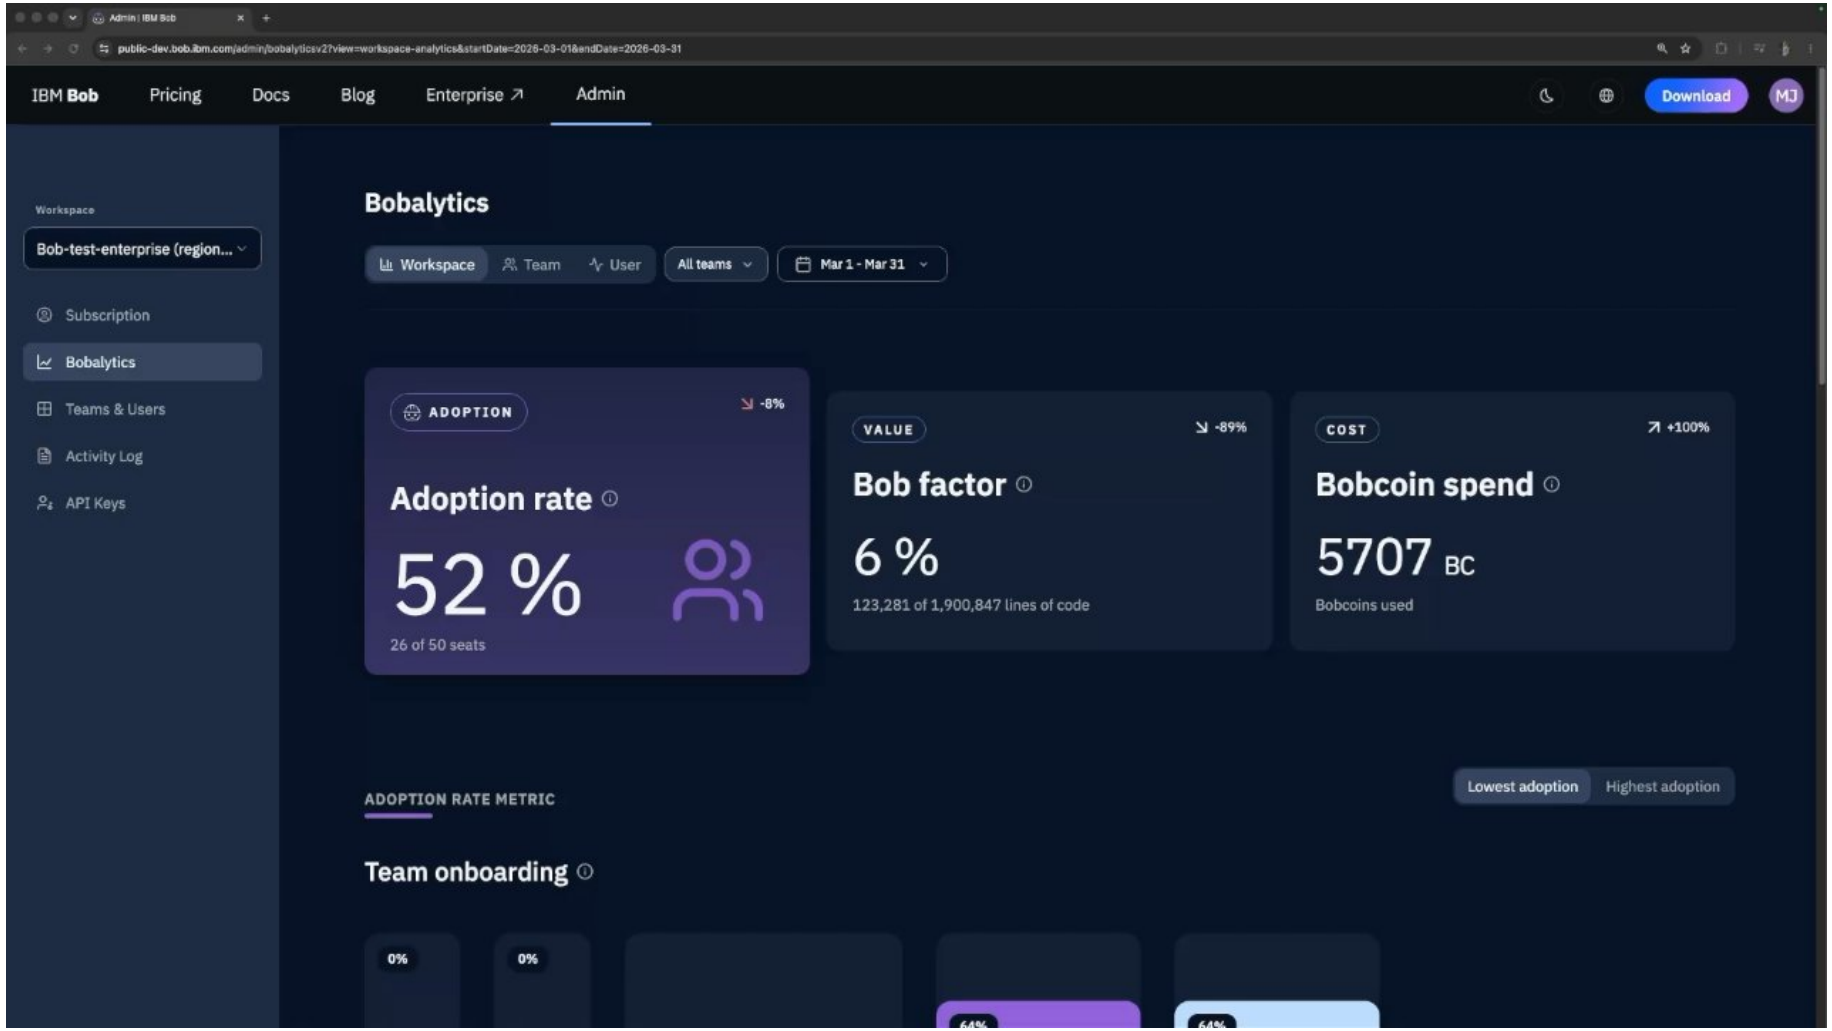

Automate workflow
↓
Reroute future tasks
↓
Refactor process
↓
Eliminate waste

Cost optimization

Cost for AI tools is real-time engineering signal that must be actively managed.

But model behavior and resource consumption are often opaque and difficult to control.

IBM Bob provides visibility, control, and optimization of cost across workflows, enabling teams to scale AI usage responsibly.

Cost optimization

Cost visibility & transparency

- Provide visibility into usage through Bobcoin tracking and Bobalytics
- Understand cost drivers across users, workflows, and outcomes
- Link usage directly to development activity and business value

Controlled resource consumption

- Manage usage through admin-level allocation and controls
- Guide efficient usage through Ask, Plan, Code workflows and custom modes
- Prevent cost overruns with structured execution and guardrails

Intelligent optimization

- Optimize performance and cost through dynamic routing and semantic understanding
- Balance accuracy, speed, and cost automatically during execution
- Reduce unnecessary resource consumption across workflows

Model abstraction & flexibility

- Abstract model selection to avoid cost and performance tradeoffs
- Reduce effort to adopt newer or more efficient models
- Avoid vendor lock-in through a flexible multi-model approach

Getting started with IBM Bob

Plans

Find the best plan for your goals

Starting your journey

How your organization could ramp up with Bob

Next steps with IBM

How teams get started with IBM Bob

Plan & play
Explore Bob through trial

—Explore Bob in an existing repo with zero workflow changes

—Run guided, read-only or low-risk agentic tasks

—Identify 1–2 high-friction tasks Bob can automate immediately

Time-to-value:
Seconds to 1 day

Senior developers + tech leads

Adopt
Identify a high-impact use case

—Select a high-impact use case

—Deploy pre-built and custom Bob Modes aligned to team workflows

—Connect Bob to repos, CI, and approved enterprise tools via MCP

Time-to-value:
<30 days

1-2 delivery teams

Accelerate
Deploy within existing environments & workflows

—Enable multi-agent orchestration across SDLC stages

—Expand to additional domains

—Embed Bob into CI/CD and GitHub workflows for continuous execution

Time-to-value:
30-90 days

DevOps owners

Scale
Scale agentic development across teams

—Roll out standardized Modes org-wide

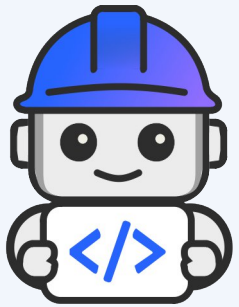

—Enforce policy, permissions, and approvals at scale

—Track outcomes, optimize cost, and evolve agent behavior over time

Time-to-value:
+3 months

Dev leaderships + BU leads
